Simple Engine Simulator

This product uses an Arduino Nano (328p). The Speeduino fork of Ardustim firmware that can simulate a variety of output patterns and options set though free software. Both code and software are open-souce.

Software and Code can be found at:
https://github.com/speeduino/Ardu-Stim

MCU

Input & LED's

Simulation

Other common non-powered resistive outputs such as CLT, IAT, are simulated through potentiometers. Powered resistive outputs such as TPS and MAP are simulated through a 5v onboard reference.
